How DoomWire Works Under the Hood

End-to-end packet journey from browser network tap to photorealistic 3D visualization:

STAGE 01
Playwright Sandbox
Launches an isolated headless Chromium instance with custom viewport and user-agent emulation.
`chromium.launch()`

STAGE 02
Network Driver Tap
Attaches an asynchronous network interceptor directly at the Chromium TCP driver layer before packets exit.
`page.route('**/*')`

STAGE 03
Sub-2ms Offline GeoIP
Resolves DNS asynchronously to IPv4, querying local MaxMind database via geoip-lite. Zero API rate limits.
`geoip.lookup(ip)`

STAGE 04
DDG Tracker Unmasking
Cross-references domains against DuckDuckGo Tracker Radar intelligence to map true parent corporations.
`Tracker Radar Graph`

STAGE 05
Active Interdiction
Either physically drops the TCP connection or modifies headers/postData with synthetic decoy noise in-flight.
`abort() vs continue()`

- Bi-directional WebSocket streaming via Socket.io
- Zero audio assets (Synthesized Web Audio API)
- Companion Manifest V3 Chrome Extension
